DETAILED ACTION

Applicant's election with traverse of Group I in the reply filed on 5/20/05 is acknowledged. The traversal is on the ground(s) that the claims in Group I, II and III require common elements and do not require an additional search. This is not found persuasive because the search is based on the required reactants of each search in that the search for Group I does not require the presence of a dihalogenated monomer, as required in Group III. Further, the composition of Group II would be incorporated into Group I based on the amendment to the claims of group II.

The requirement is still deemed proper and is therefore made FINAL.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fuller et al (5,814,426) of record on 1449.

The reference discloses polymers having the formulae (III-VIII) (see cols 1-2, cols 27-28; cols 37-380 in that C component (see col. 14, line 20 et seq.: col. 17, line 35 et seq.) in that the last formula can be considered the claimed phenol compound of the formula $\text{Ar}(\text{OH})_x$ wherein $x > 3$ and R is an aryl group, and a polymer comprising a polycarbonate (see col. 36, line 51) to produce a polymeric binder.

The disclosure of the reference differs from the instant claims in that it does not disclose the claimed phenolic compound of the formula $\text{Ar}(\text{OH})_x$ wherein $x > 3$.

However, the reference does disclose a C component in that the last formula can be considered $\text{Ar}(\text{OH})_4$, as in the claims.

Therefore, it would have been obvious to one of ordinary skill in the art to select the phenolic compound from the reference within the limitations of the instant claims since they have been shown to be effective in a similar system and thus would have been expected to provide adequate results. There is no showing of unexpected results derived from said selection.
